

FM-pipeline

FineMapping analysis using GWAS summary statistics

INTRODUCTION

This is a pipeline for finemapping using GWAS summary statistics, implemented in Bash as a series of steps to furnish an incremental analysis. As depicted in the diagram below

LocusZoom plot showing Regional association for chr1:39114617-39614617

where our lead SNP rs4970634 is in LD with many others, the procedure attempts to identify causal variants from region(s) showing significant SNP-trait association.

The process involves the following steps, 1. Extraction of effect (beta)/z statistics from GWAS summary statistics (.sumstats), 2. Extraction of correlation from the reference panel among overlapped SNPs from 1 and the reference panel containing individual level data. 3. Information from 1 and 2 above is then used as input for finemapping.

The measure of evidence is typically (log10) Bayes factor (BF) and associate SNP probability in the causal set.

Information on whole-genome analysis, which could be used to set up the regions, are described at the repository's [wiki page](#).

INSTALLATION

Software options included in this pipeline are listed in the table below.

| Option | Name | Function | Input | Output | Reference |
|------------|----------------|-------------------------------|--|--|-------------------------------|
| CAVIAR | CAVIAR | finemapping | z, correlation matrix | causal sets and probabilities | Hormozdiari, et al. (2014) |
| CAVIARBF | CAVIARBF | finemapping | z, correlation matrix | BF and probabilities for all configurations | Chen, et al. (2015) |
| GCTA | GCTA | joint/conditional analysis | .sumstats, reference data | association results | Yang, et al. (2012) |
| FM_summary | FM- summary | finemapping | .sumstats | posterior probability & credible set | Huang, et al. (2017) |
| JAM | JAM | finemapping | beta, individual reference data | Bayes Factor of being causal | Newcombe, et al. (2016) |
| LocusZoom | LocusZoom | regional plot | .sumstats | .pdf/.png plots | Pruim, et al. (2010) |
| fgwas | fgwas | functional GWAS | .sumstats | functional significance | Pickrell (2014) |
| finemap | finemap | finemapping | z, correlation matrix | causal SNPs and configuration | Benner, et al. (2016) |

so they range from regional association plots via LocusZoom, joint/conditional analysis via GCTA, functional annotation via fgwas to dedicated finemapping software including CAVIAR, CAVIARBF, an adapted version of FM-summary, R2BGLiMS/JAM and finemap. One can optionally use a subset of these for a particular analysis by specifying relevant flags from the pipeline's settings.

On many occasions, the pipeline takes advantage of the [GNU parallel](#). Besides (sub)set of software listed in the table above, the pipeline requires [qctool](#) 2.0, [PLINK](#) 1.9, and the companion program LDstore from finemap's website need to be installed. To facilitate handling of graphics, e.g., importing them into Excel, pdftopng from [XpdfReader](#) is used. We use [Stata](#) and Sun grid engine (sge) for some of the data preparation, which would become handy when available.

The pipeline itself can be installed in the usual way,

```
git clone https://github.com/jinghuazhao/FM-pipeline
```

The setup is in line with summary statistics from consortia where only RSid are given for the fact that their chromosomal position may be changed over different builds.

USAGE

Before start, settings at the beginning of the script need to be changed and only minor change is expected after this.

```
# software flags: 1=enable
```

```
export CAVIAR=0
export CAVIARBF=0
export FM_summary=0
export GCTA=0
export JAM=1
export LocusZoom=0
export fgwas=0
export finemap=1
```

```
# Default location and reference data
```

```
export FM_location=/genetics/bin/FM-pipeline
```

```
# GEN files named chr{chr}_{start}_{end}.gen.gz
```

```
export GEN_location=$FM_location/1KG/LD-blocks
```

```
# sample file
```

```
export sample_file=$FM_location/1KG/EUR.sample
```

```
# Complementary files for fgwas
```

```
export fgwas_location_1kg=/genetics/data/fgwas/1000-genomes
```

```
## OTHER SETTINGS
```

```
# parallel processes when available
```

```
export threads=1
```

```
# environmental variables
```

```
export PATH=/genetics/bin:/usr/local/bin:$PATH:/genetics/data/software/bin
```

```
export R_LIBS=/usr/local/lib/R/site-
```

```
library:/genetics/bin/R:/usr/local/lib64/R/library:/genetics/data/software/R
```

```
export
```

```
LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/usr/local/lib64/R/lib:/genetics/data/software/lib
```

The syntax of the pipeline is then simply

```
bash fmp.sh <input>
```

Inputs

--- GWAS summary statistics ---

The input will be GWAS summary statistics described at <https://github.com/jinghuazhao/SUMSTATS>.

This format is in line with joint/conditional analysis by GCTA.

--- Reference panel ---

The pipeline uses a reference panel in a .GEN format, taking into account directions of effect in both the GWAS summary statistics and the reference panel. Its development will facilitate summary statistics from a variety of consortia as with reference panels such as the HRC and 1000Genomes.

A .GEN file is required for each region, named such that chr{chr}_{start}_{end}.gen, together with a sample file. For our own data, [st.do](#) is written to generate such files from their whole chromosome counterpart using SNPinfo.dta.gz which has the following information,

| chr | rsid | RSnum | pos | FreqA2 | info | type | A1 | A2 |
|-----|-------------|-------------|-------|----------|--------|------|-----|-----|
| 1 | 1:54591_A_G | rs561234294 | 54591 | .0000783 | .33544 | 0 | A | G |
| 1 | 1:55351_T_A | rs531766459 | 55351 | .0003424 | .5033 | 0 | T | A |
| ... | ... | ... | ... | ... | ... | ... | ... | ... |

Note that unlike fmp.sh, the utility program uses qctool-1.4 for its more comprehensive options. In line with qctool -excl-samples option, it contains a list of individuals corresponding to ID_2 of the [sample file](#) rather than ID_1 and ID_2.

--- The lead SNPs ---

Given these, one can do away with Stata and work on a text version for instance SNPinfo.txt. An auxiliary file called st.bed contains chr, start, end, rsid, pos, r corresponding to the lead SNPs specified and r is a sequence number of region.

Outputs

The output will involve counterpart(s) from individual software, i.e., .set/post, caviarbf, .snp/.config, .jam/.top

| Software | Output type | Description |
|------------|---------------|--|
| CAVIAR | .set/.post | causal set and probabilities in the causal set/posterior probabilities |
| CAVIARBF | .caviarbf | causal configurations and their BFs |
| FM-summary | .txt | additional information to the GWAS summary statistics |
| GCTA | .jma.cojo | joint/conditional analysis results |
| JAM | .jam/.top/.cs | posterior summary table, top models containing selected SNPs and credible sets |
| finemap | .snp/.config | top SNPs with largest log10(BF) and top configurations as with their log10(BF) |

It is helpful to examine directions of effects together with their correlation which is now embedded when finemap is also called.

In addition, we have implemented clumping using PLINK with options comparable to those used in depict (e.g. description in [PW-pipeline](#)).

EXAMPLE

Files `bmi.txt` and `97.snps` are described in <https://github.com/jinghuazhao/SUMSTATS>.

--- 1000Genomes panel using approximately indepdent LD blocks ---

This is available as [FUSION LD reference panel](#), with [1KG.sh](#) to generate `SNPinfo.dta.gz` and [st.do](#) to generate the script [Extract.sh](#) for the required data.

We then proceed with.

```
awk '{gsub(/chr/, "", $0); if(NR==1) {print "chr", "start", "end", "region"} else
print $1, $2, $3, $4}' 1KG/EUR.bed > st.bed
cp bmi.txt BMI_1KG
cp fmp.sh BMI_1KG.sh
# modify BMI_1KG.sh to use the 1KG panel
BMI_1KG.sh BMI_1KG
```

and the results will be in `BMI_1KG.out`.

--- HRC panel ---

File `97.snps` is used to build `st.bed` and the analysis proceed as follows,

```
# st.bed
grep -w -f 97.snps snp150.txt | \
sort -k1,1n -k2,2n | \
awk -vflanking=250000 '{print $1, $2-flanking, $2+flanking, $3, $2, NR}' > st.bed
cp fmp.sh BMI_HRC.sh
# modify BMI_HRC.sh to use the HRC panel
export GEN_location=/scratch/tempjhz22/LDcalc/HRC
BMI_HRC.sh BMI_HRC
```

and the results will be in `BMI_HRC.out`.

ADDITIONAL TOPICS

The [wiki page](#) has the following information,

- [Whole-genome conditional/joint analysis](#)
- [Whole genome analysis using approxmiately independent LD blocks](#).

RELATED LINK

Credible sets are often described, see <https://github.com/statgen/gwas-credible-sets>

ACKNOWLEDGEMENTS

The work was motivated by finemapping analysis at the MRC Epidemiology Unit and inputs from authors of GCTA, finemap, JAM, FM-summary as with participants in the Physalia course Practical GWAS Using Linux and R are greatly appreciated. In particular, the [utility program in Stata](#) was adapted from [p0.do](#) (which is still used when LD_MAGIC is enabled) originally written by Dr Jian'an Luan and [computeCorrelationsImpute2forFINEMAP.r](#) by Ji Chen from the MAGIC consortium who also provides code calculating the credible set based on finemap configurations. Earlier version of the pipeline also used [GTOOL](#).
